DATA MODELLING AND FORM DESIGN FOR INSURANCE CLAIM REQUEST IN ZOHO CREATOR

Varun S 241401124

BTECH CSBS

AIM:

To design and build a functional "Insurance Claim Request Form" application in Zoho Creator that demonstrates the correct usage of all thirteen Basic Fields available in the Form Builder, while solving a real insurance-management requirement of collecting, validating, and organizing claim requests from policyholders, nominees, or third parties.

PROCEDURE:

1. DATA MODEL DESIGN:

Before building the form, the data requirement was analysed and organised into a simple data model, grouping the fields under four logical sections that map to the stages of an insurance claim journey: Claimant Details, Claim Details, Supporting Documents & Follow-up, and Declaration & Processing.

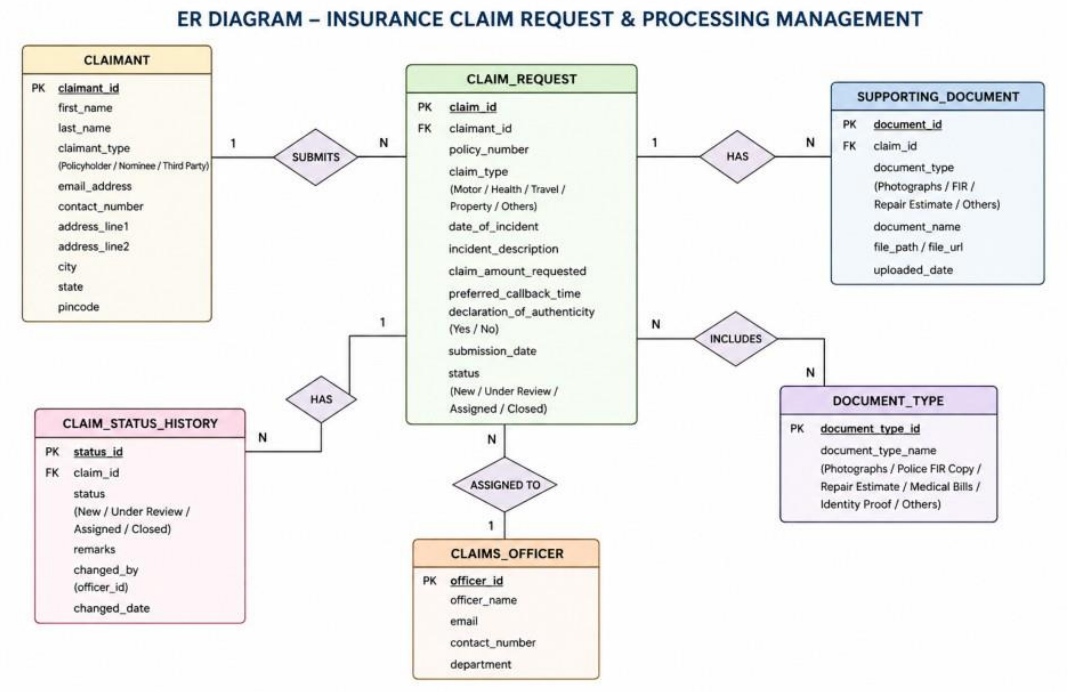

Fig 1. Data Model — Insurance Claim Request Form and its related
Claimant, Supporting Document, Document Type, Status History, and Claims Officer entities

2. Application and Form Creation

1. Logged into Zoho Creator and clicked Create New Application → Create from Scratch.
2. Named the application "Insurance Claim Request & Processing Management" and confirmed creation, which opened the default blank workspace.
3. Inside the application, opened the Forms panel and clicked the + icon to add a new form, naming it Claim_Request_Form.
4. This automatically created a linked report, Claim_Request_Report, which will list every submitted claim request.

3. Drag-and-Drop of Basic Fields

In the Form Builder, the Basic Fields palette was expanded on the left panel. Each required field was dragged from the palette and dropped onto the canvas in the order needed, then double-clicked to open its Field Properties panel for renaming and configuration, as listed below.

Basic Field	Form Field Name	Purpose	Sample Value
Name	Claimant_Name	Captures the full name of the claimant using First/Last name sub-fields	Sarvesh R
Email	Email_Address	Captures a validated email address for claim correspondence and updates	sarvesh@gmail.com
Address	Claimant_Address	Captures the claimant's complete residential or mailing address	Trichy, Tamil Nadu, 600987, India
Phone	Contact_Number	Captures a validated mobile number for claim communication	+91 9184957451
Single Line	Policy_Number	Captures the policy number associated with the claim	POL-2026-001
Multi Line	Incident_Description	Captures a detailed description of the incident or loss	Vehicle damage after road accident
Number	Claim_Amount_Requested	Captures the amount requested by the claimant	75000
Date	Date_Of_Incident	Captures the date on which the insured incident occurred	15-Aug-2026
Time	Preferred_Callback_Time	Captures the claimant's preferred callback time	11:30 AM
Drop Down	Claim_Type	Presents a single-select list of insurance claim categories	Motor
Radio	Claimant_Type	Captures a single claimant relationship selection	Policyholder
Multi Select	Supporting_Document_Type	Allows selection of one or more supporting document categories	Photographs, FIR
Checkbox	Declaration_Of_Authenticity	Captures the claimant's acknowledgement that the submitted information is authentic	Checked (Yes)

4. Organising Fields into Sections

To keep the claim request form user-friendly and logically grouped, a Section field was dragged from the Layout palette above each group of related fields, and the dropped fields were dragged again to nest them under the correct section header. Four sections were created in this way:

- Section A — Claimant Details: Claimant_Name, Claimant_Type, Email_Address, Contact_Number, Claimant_Address.
- Section B — Claim Details: Policy_Number, Claim_Type, Date_Of_Incident, Incident_Description, Claim_Amount_Requested.
- Section C — Supporting Documents & Follow-up: Supporting_Document_Type, Preferred_Callback_Time.
- Section D — Declaration & Processing: Declaration_Of_Authenticity.

Each section header was renamed by double-clicking it and typing the section title, and fields within a section were reordered using drag handles until the layout matched the intended claim journey from claimant identification to declaration.

5. Applying Field-Level Validations

1. Selected Claimant_Name, Contact_Number, Email_Address, Policy_Number, Claim_Type, Date_Of_Incident, Claim_Amount_Requested, and Declaration_Of_Authenticity one by one and enabled the Mandatory toggle in Field Properties.
2. Opened Email_Address properties and confirmed the built-in email format validation was active.
3. Opened Contact_Number properties and set the phone format to the Indian country-code pattern.
4. Opened Claim_Amount_Requested properties and set Minimum Value = 1.
5. Opened Date_Of_Incident properties and restricted selectable dates to today and past dates only, disallowing future incident dates.
6. Confirmed under Declaration_Of_Authenticity that the Claim button remains disabled until the checkbox is checked.

6. Preview and Deployment

1. Clicked the Preview icon in the Form Builder toolbar to view the live claimant-facing form and verified that all four sections render in order with correct field types.
2. Filled and submitted sample claim requests through the preview/live form to test validations and generate report data.

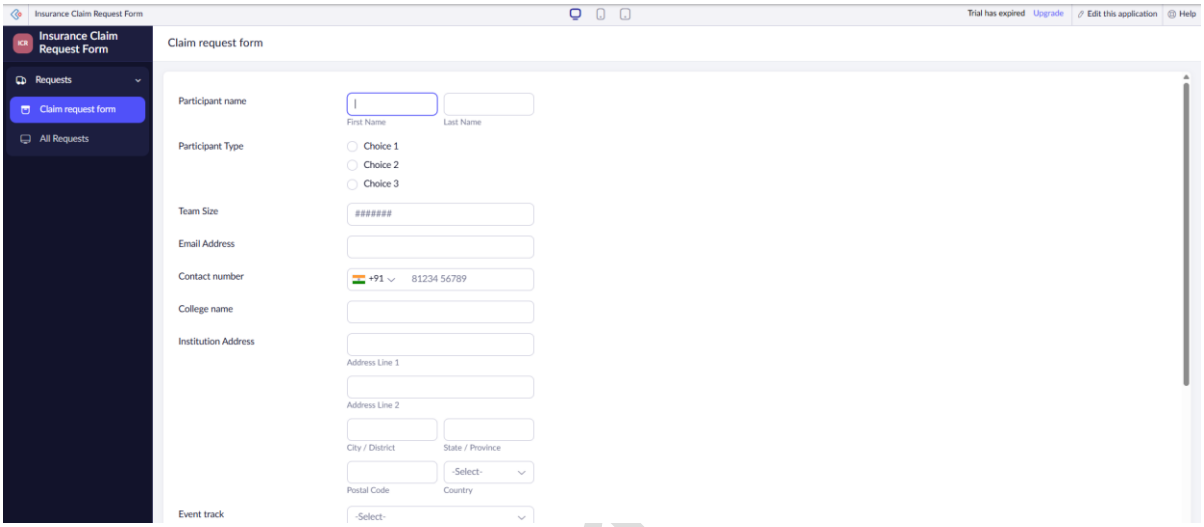

24140124

3. Opened Claim_Request_Report from the Reports panel and verified that all submitted records appear with values mapped correctly to each field.

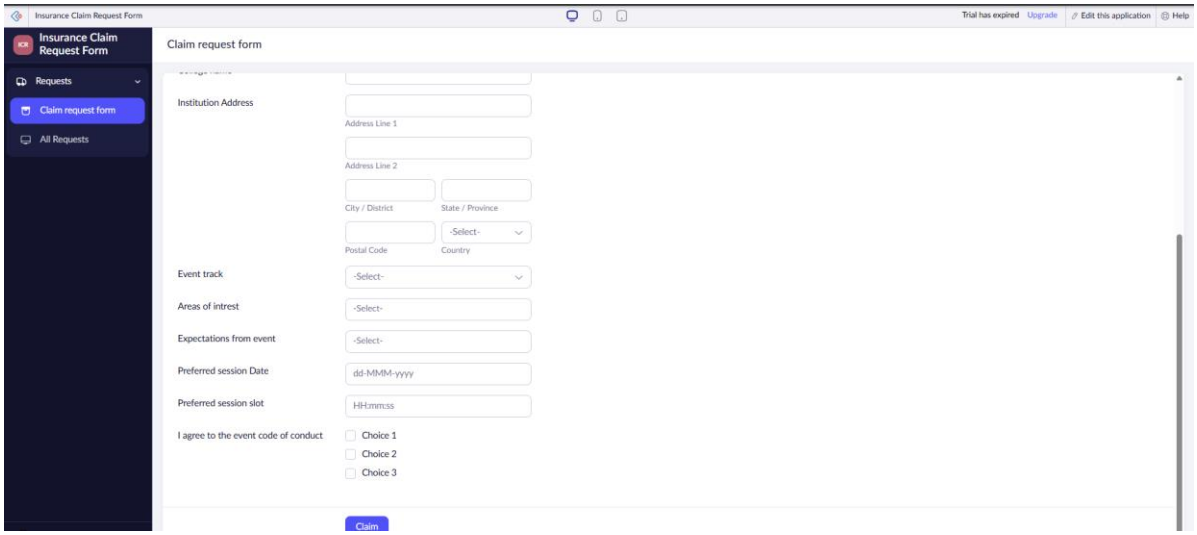

4. Applied a filter on Claim_Type and Status in the report view to confirm the claims team can review and organise requests according to category and processing stage.

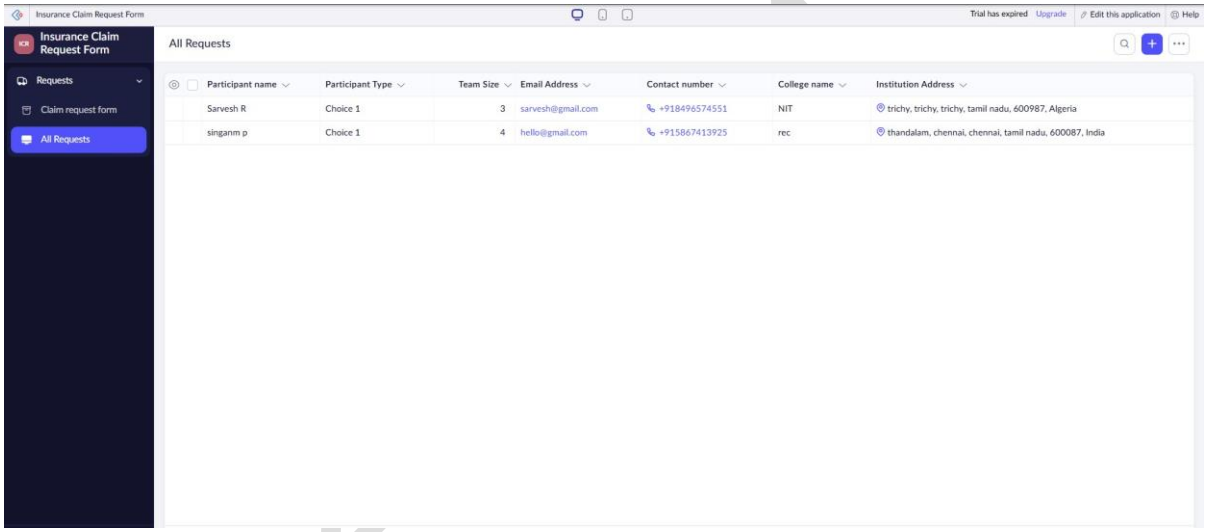

OUTPUT:

The following screenshots capture the completed application: the Claim request form showing the configured basic fields and the All Requests report containing sample submitted records.

RESULT

An Insurance Claim Request Form application was successfully designed and built in Zoho Creator using all thirteen Basic Fields — Name, Email, Address, Phone, Single Line, Multi Line, Number, Date, Time, Drop Down, Radio, Multi Select, and Checkbox. The fields were logically grouped into four sections through drag-and-drop, mandatory and format-level validations were configured successfully, and the Claim_Request_Report was verified to correctly capture and list claim request data submitted through the form. The exercise thus demonstrated an understanding of data modelling and low-code form design for a real insurance claim-management use case.
