AIM

To automate business processes in a low-code application using form workflows and Deluge scripting, and to test the application and debug the errors in the Deluge script.

Objectives

- To create a form workflow that runs when a claim request is submitted.
- To add a Deluge script action to a workflow to process the claim data.
- To test the script using the info statement.
- To find and fix an error in a Deluge script.
- To check that the whole automation works correctly.

PROCEDURE

Part A: Automation Using Workflows

1. Open the Insurance Claim Request & Processing Management application in Zoho Creator and go to the Workflow section.
2. Click the New Workflow button in the Form workflows tab.
3. In the "Run workflow on any event in the form" page, choose Claim_Request_Form in the Choose form list.
4. Under "Run when a record is", select the record event. The options are Created, Edited, Created or Edited and Deleted.
5. Select Created or Edited as the record event.
6. In the "When to trigger workflow" list, select Successful form submission.
7. In the Name the workflow box, type Send Claim Acknowledgement Email.
8. Click the Create Workflow button.
9. The workflow builder opens. The path at the top shows: Claim_Request_Form > Created or Edited > Successful form submission > Send Claim Acknowledgement Email.
10. Click Add New Action to add what the workflow should do. Click Done to save the workflow.
11. Open the Claim_Request_Form Report to check the records that are submitted through the form and used for testing.

Part B: Automation Using Deluge Scripting

1. Create another form workflow for Claim_Request_Form. Give it the name Deluge Claim Processing, use the record event Created, and the form event Successful form submission.
2. In the workflow builder, click Add New Action.
3. In the Add New Action window, keep the Run this action option as Always.

24A0124

4. From the Action type list, select Deluge script.
5. In the Deluge editor, write the script that prints the claim details using info statements. The script reads Claimant_Name, Policy_Number, Claim_Type and Claim_Amount_Requested from the input variable.
6. Click Update to save the script.
7. The script now appears inside the workflow under "Execute without condition". Click Done.

Part C: Debugging Errors in Deluge

1. Open the saved Deluge script again for testing.
2. Change the field name Claim_Type to Wrong_Claim_Type on line 4. This makes a wrong field name on purpose.
3. Click Update. The editor shows an error message: "Error at line number: 4 – Variable 'Wrong_Claim_Type' is not defined."
4. Read the line number and the message. They show that the field name does not exist in the form.
5. Change the name back to Claim_Type and click Update again. The script saves without any error.

Part D: Checking the Working of the Automation

1. Go to Workflow > Form workflows and select Claim_Request_Form.
2. Check the list of workflows, the number of actions in each one, and the status. All workflows should show Enabled.
3. Submit a new claim in the application. The workflows run on successful form submission and the record is added to the report.

OUTPUT

AUTOMATION PROCESS USING WORKFLOWS

1. Creating a New Form Workflow

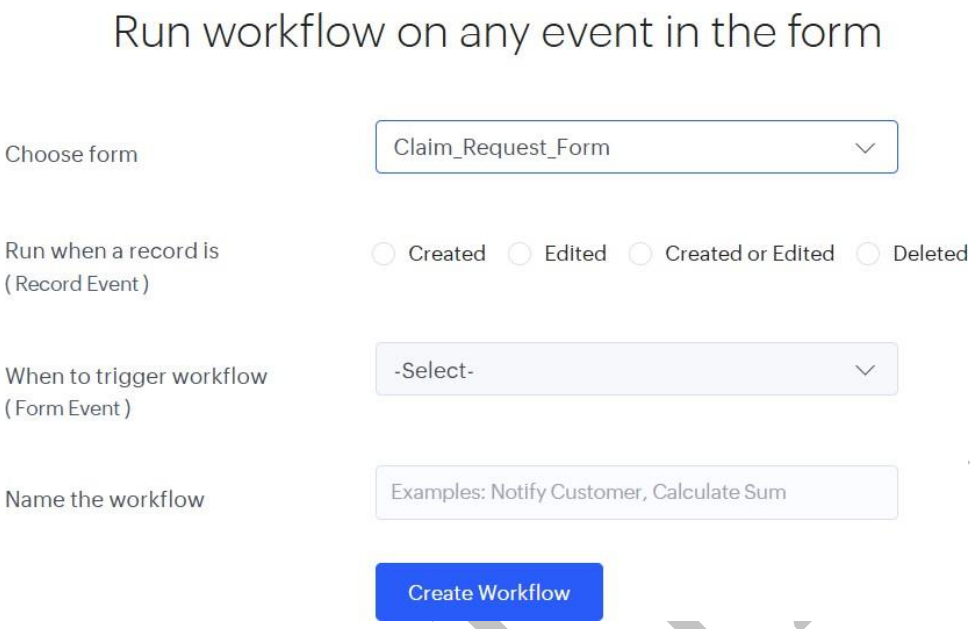

Fig 1: Run workflow on any event in the form – Claim_Request_Form selected

The first screen of the workflow wizard. The form Claim_Request_Form is chosen. The record event, form event and the workflow name are still empty at this stage.

2. Workflow Settings Filled In

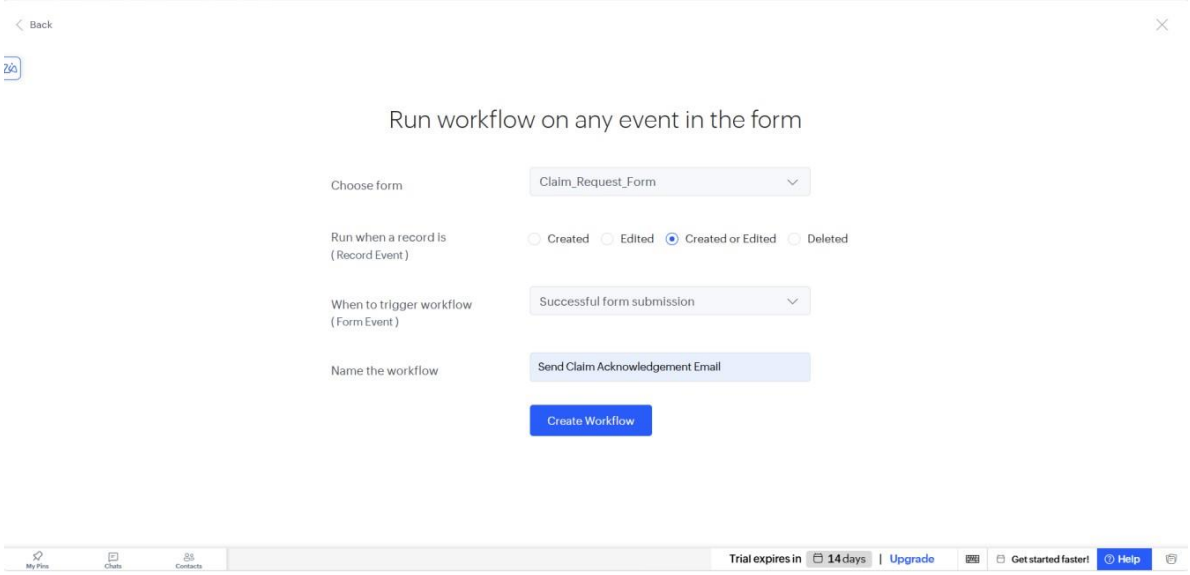

Fig 2: Record event, form event and name of the workflow

The record event is set to Created or Edited and the form event is set to Successful form submission. The workflow is named Send Claim Acknowledgement Email. Clicking Create Workflow opens the builder.

3. Workflow Builder

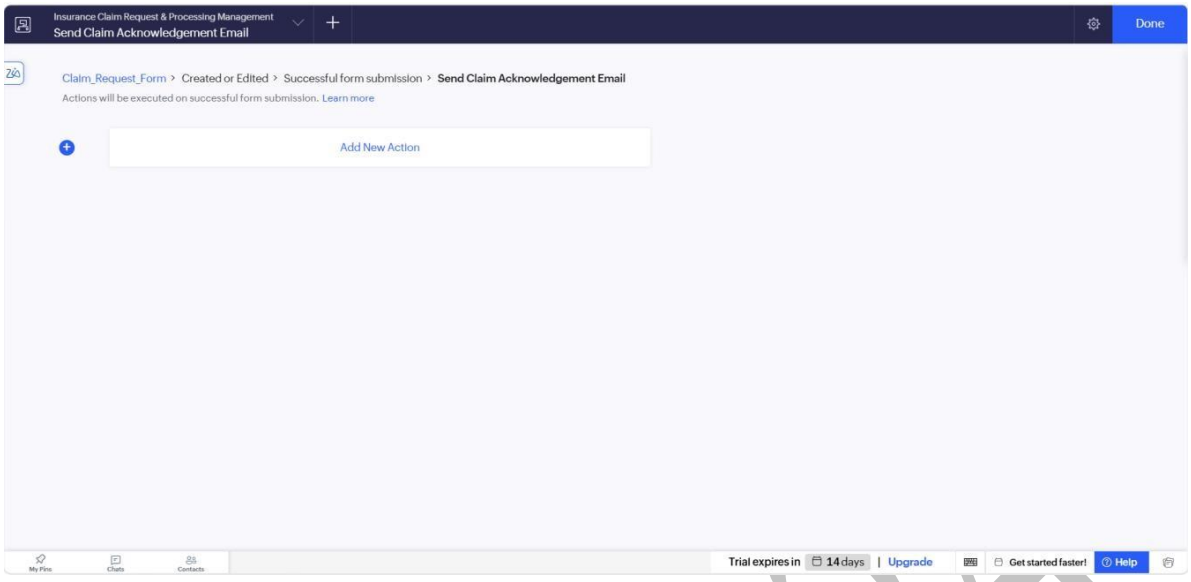

Fig 3: Workflow builder showing the path and the Add New Action button

The top path shows Claim_Request_Form > Created or Edited > Successful form submission > Send Claim Acknowledgement Email. The message below it says that actions will run on successful form submission. Actions are added with the Add New Action button.

4. Claim_Request_Form Report

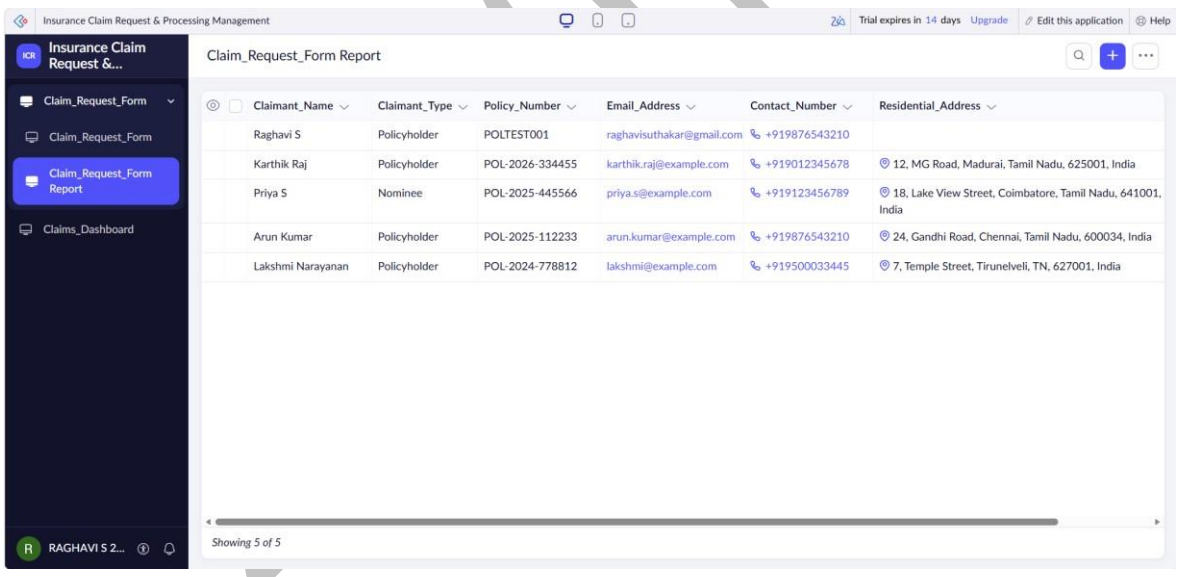

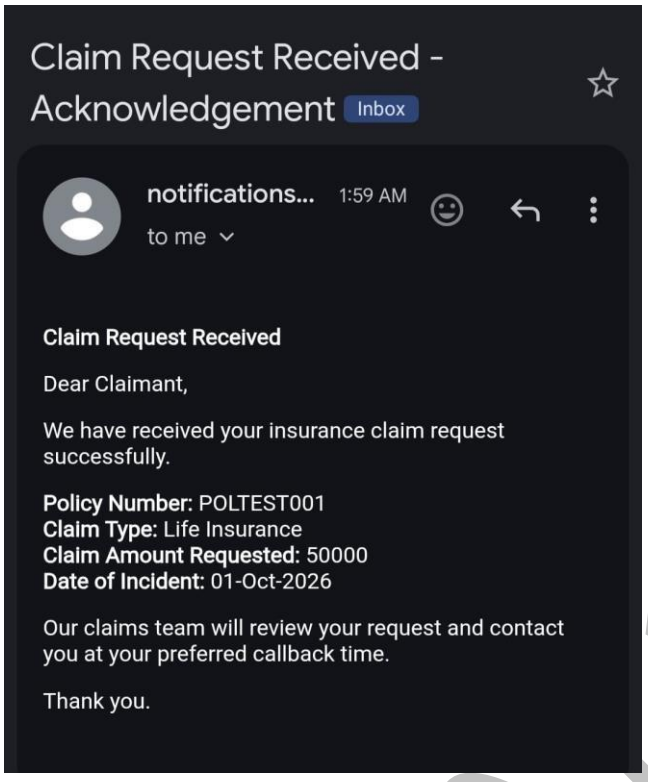

Fig 4: Report showing the claim records stored by the form

The report lists five records with Claimant_Name, Claimant_Type, Policy_Number, Email_Address, Contact_Number and Residential_Address. These records come from form submissions and are used to test the workflows.

NOTIFICATION RECEIVED USING WORKFLOW PROCESS

AUTOMATION PROCESS USING DELUGE SCRIPTING

5. Deluge Script Action

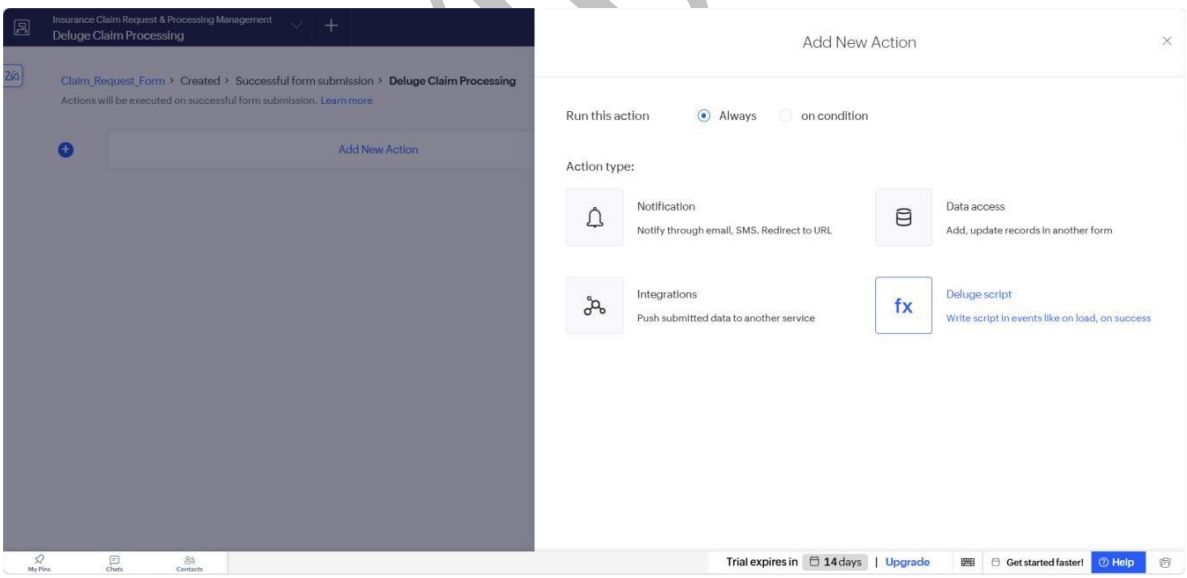

Fig 5: Add New Action window showing the action types

The workflow Deluge Claim Processing uses the event Created and Successful form submission. The Run this action option is Always. The four action types are Notification, Data access, Integrations and Deluge script. Deluge script is selected.

6. Writing the Deluge Script

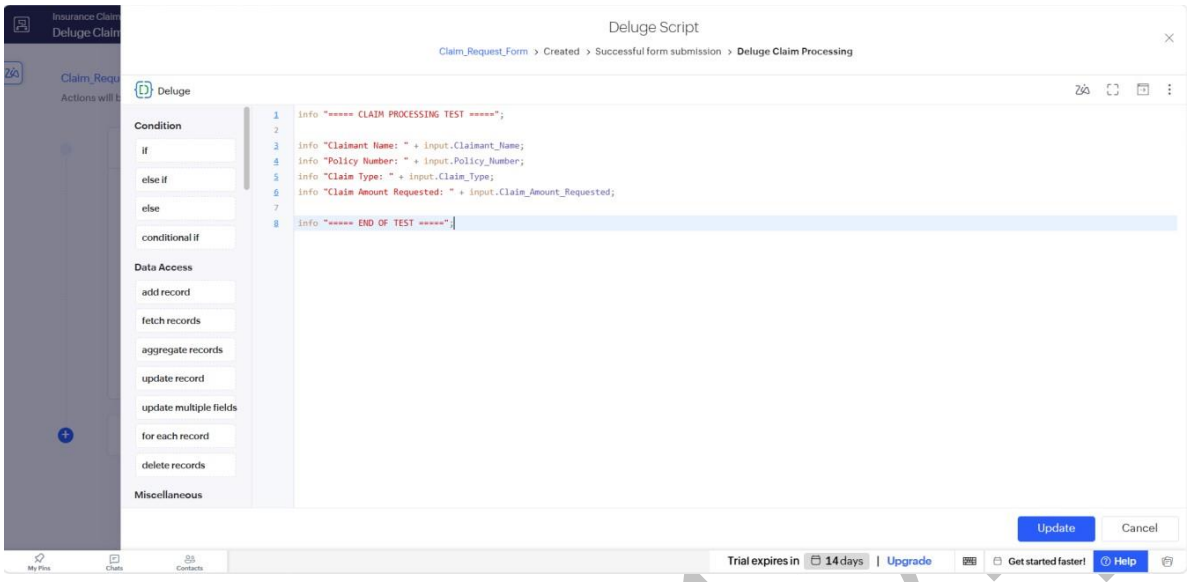

Fig 6: Deluge script editor with the claim processing test script

The script uses info statements to print the Claimant Name, Policy Number, Claim Type and Claim Amount Requested. These values are read from the form using input.<field name>. The script starts and ends with a line marker so the output is easy to find and also we can use zia ai which helps to write deluge script.

7. Deluge Script Added to the Workflow

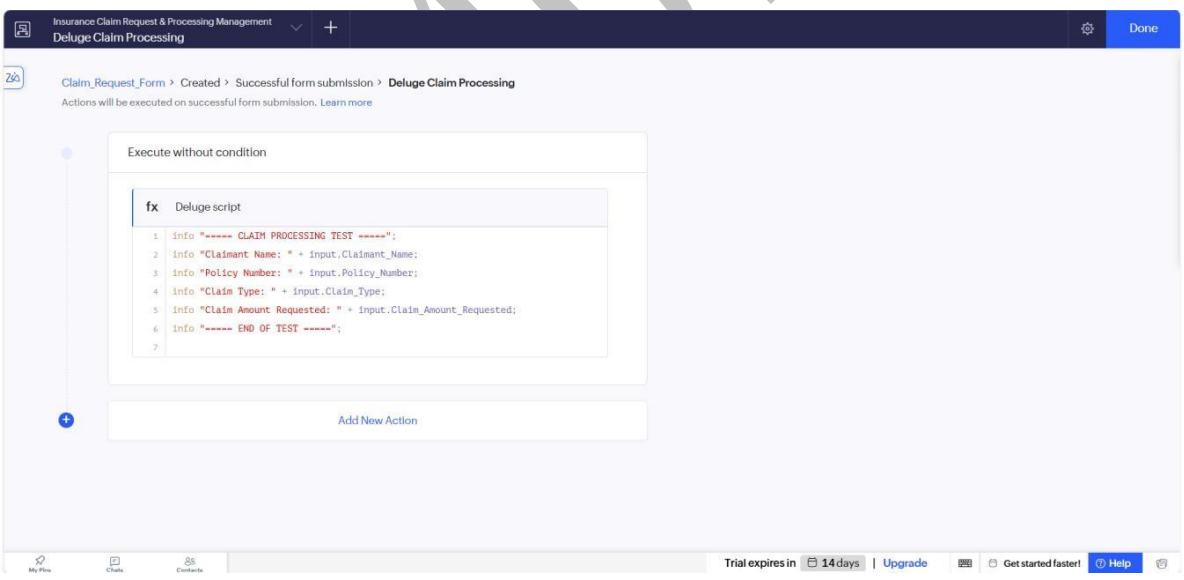

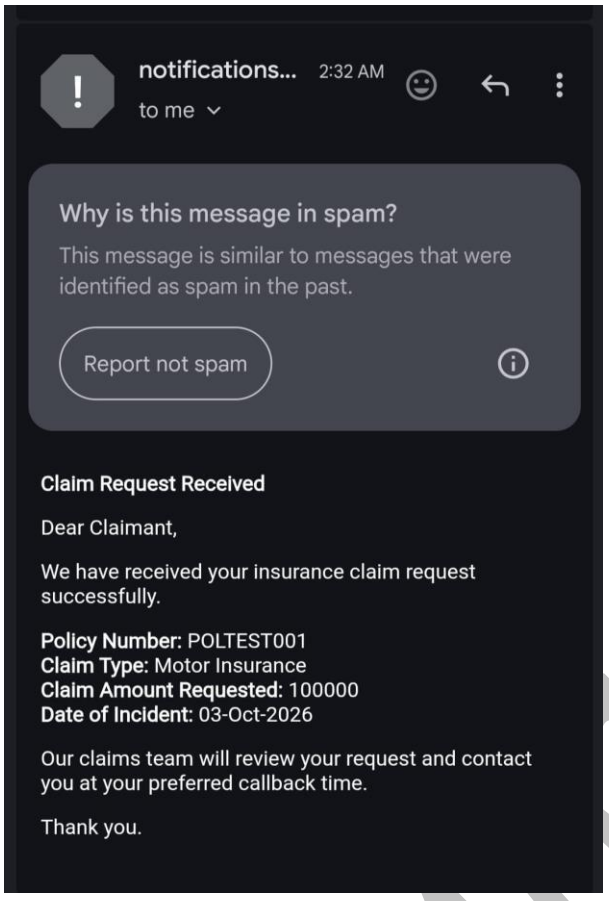

Fig 7: Saved Deluge script inside the workflow

After clicking Update, the script is shown in the workflow under Execute without condition. This means it runs every time the workflow is triggered.

NOTIFICATION RECEIVE THROUGH DELUGE SCRIPTING

DEBUGGING

8. Debugging an Error in the Deluge Script

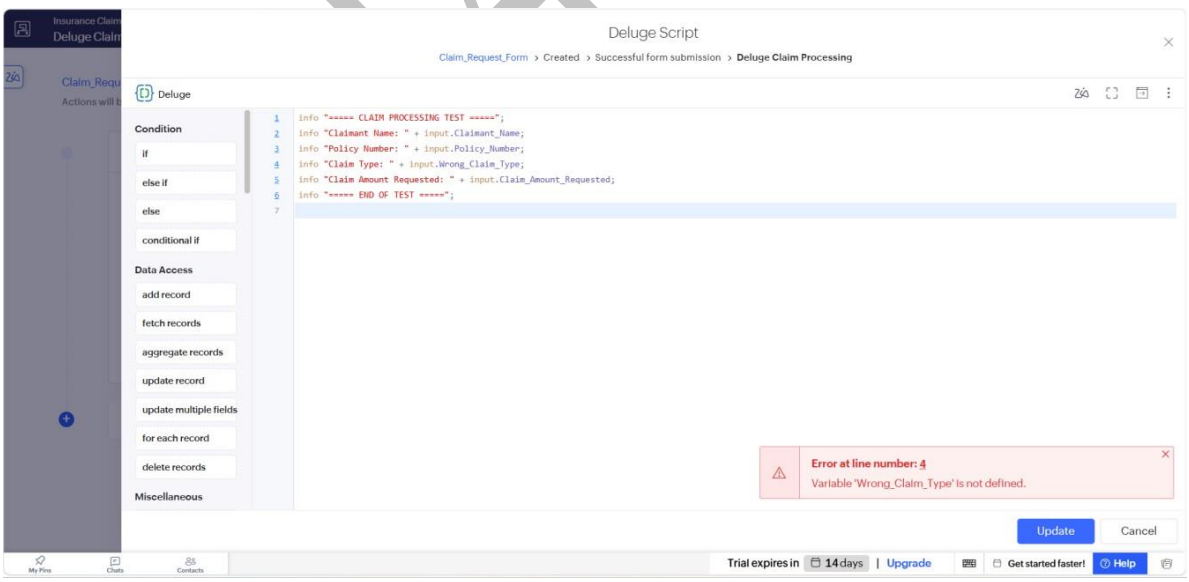

Fig 8: Error message for an undefined variable on line 4

Line 4 uses input.Wrong_Claim_Type, but no field with this name exists in the form. The editor shows "Error at line number: 4 – Variable 'Wrong_Claim_Type' is not defined." The script cannot be saved until the name is corrected to Claim_Type.

FINAL APPLICATION TESTING

9. Working of the Automation Process

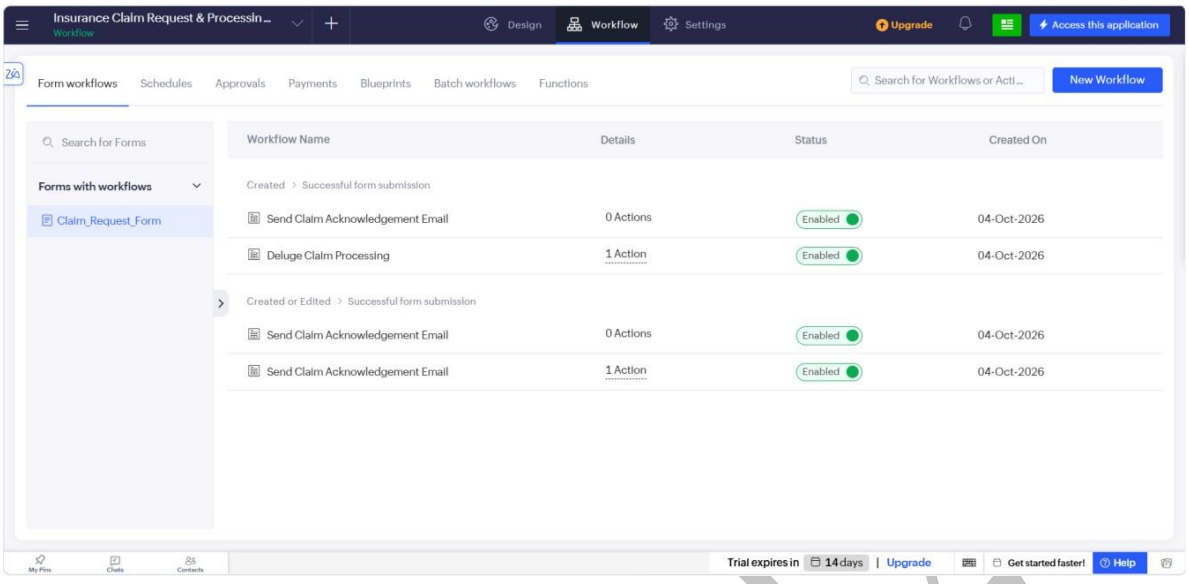

Fig 9: Form workflows list showing all workflows enabled

The list shows the workflows created for Claim_Request_Form, grouped by their record event. Every workflow has the status Enabled and the creation date 04-Oct-2026. The summary is in the table below.

FINAL RESULT

Business processes for the Insurance Claim Request & Processing Management application were automated in Zoho Creator using form workflows and Deluge scripting. Workflows were created to run on successful form submission. A Deluge script was added to read and process the claim details. An undefined variable error was created on purpose, read from the error message, and fixed. All the workflows were enabled and the automation worked as expected.
