Configuring User Management and Role-Based Access Control (RBAC) in a Zoho Creator Application

Name: Varun S **Roll Number:** 241401124

Title

Configuring user permissions, roles and role hierarchy in the Insurance Claim Request & Processing Management application in Zoho Creator.

Aim

To set up role-based access control (RBAC) in the Insurance Claim Request & Processing Management application by creating permission sets and a role hierarchy, and to understand how data sharing works in Zoho Creator.

Objectives

- To create permission sets for the Claims Manager and the Claims Officer.
- To build the role hierarchy CEO > Claims Manager > Claims Officer.
- To understand how permissions, roles and data sharing work together.
- To learn why each user should get only the access that the job needs.

Software / Tools Required

- Zoho Creator
- Insurance Claim Request & Processing Management application
- Web browser with internet connection
- Zoho account with permission to edit the application

Introduction / Theory

User management: It decides who can open an application and what each person can see or do. In Zoho Creator, these settings are in three tabs: Permissions, Roles and Data Sharing.

Role-Based Access Control (RBAC): Instead of setting access for every person one by one, we give access to roles. A user gets the rights of the role they are assigned. This keeps the application safe and easy to manage.

Least privilege: A user should have only the access needed to do their work. For example, a claims officer needs to see and update claims, but does not need to change the whole application.

Key Concepts

Concept	Meaning
Permissions	A named set of actions a user is allowed to do in the application.
Roles	Positions in the organization, such as CEO or Claims Manager.
Role Hierarchy	Shows who reports to whom. A higher role can see the records of the roles below it.

Data Sharing	A rule that lets selected roles or users see records of others, as Read Only or Read/Write.

Application Details

Item	Detail
Application Name	Insurance Claim Request & Processing Management
Main Form	Claim_Request_Form
Custom Permission Sets	Claims_Manager_Permission, Claims_Officer_Permission
Default Permission Sets	Read, Write
Role Hierarchy	CEO > Claims Manager > Claims Officer

Procedure

1. Sign in to Zoho Creator and open the Insurance Claim Request & Processing Management application in edit mode.
2. Click Settings and then User Permissions. The page shows three tabs: Permissions, Roles and Data Sharing.
3. Open the Permissions tab. Check the two custom permission sets and the two default sets, Read and Write.
4. Open the Roles tab. Click Expand All to see the full role tree.
5. Check that Claims Manager is placed under CEO, and Claims Officer is placed under Claims Manager.
6. Open the Data Sharing tab. Here a New Share Rule can be added to share a form’s records between roles with Read Only or Read/Write access.

Output

1. Permissions Tab

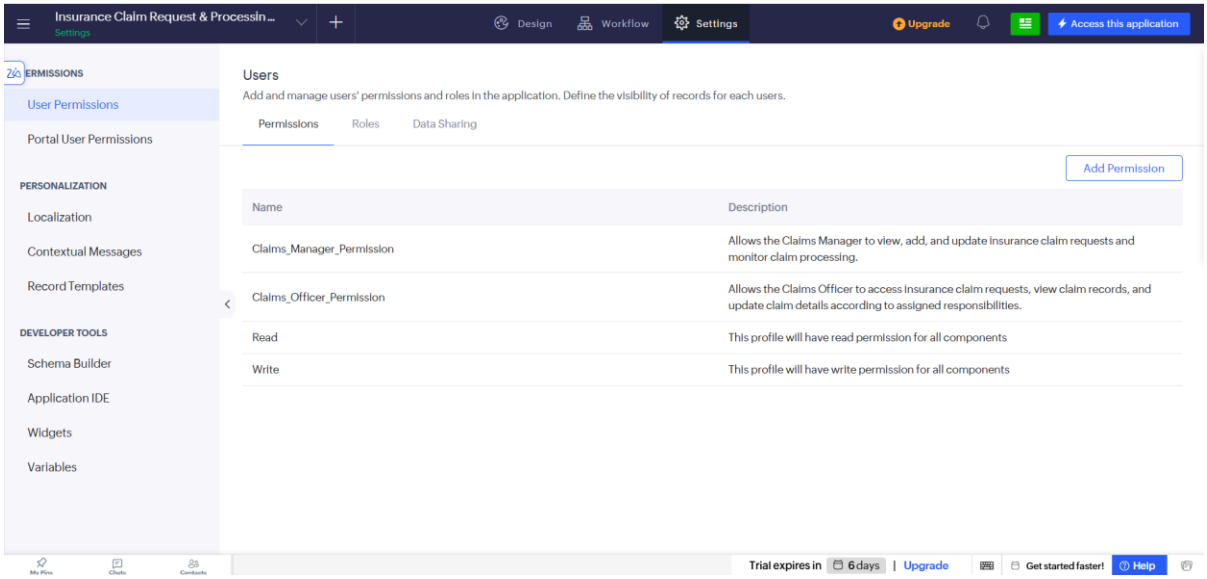

Figure 8.1: Permissions tab with Claims_Manager_Permission, Claims_Officer_Permission, Read and Write

2. Roles Tab

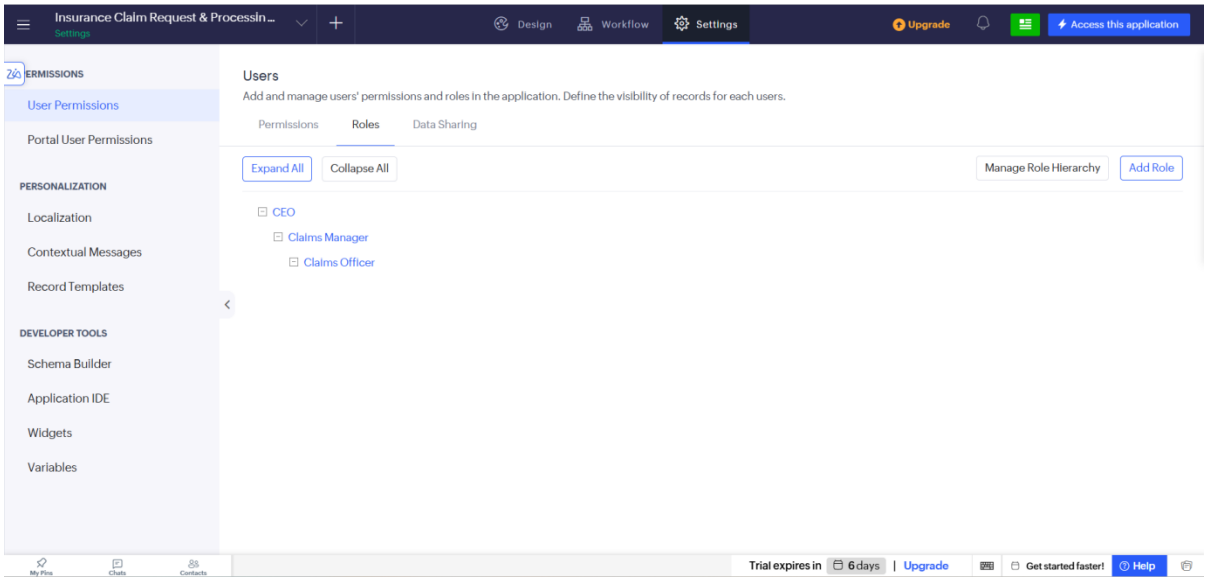

Figure 8.2: Roles tab showing CEO > Claims Manager > Claims Officer

Permission Sets

Permission Set	What it allows
Claims_Manager_Permission	View, add and update claim requests, and monitor claim processing.
Claims_Officer_Permission	Access claim requests, view claim records and update claim details as per assigned work.
Read	Read permission for all components.

Write	Write permission for all components.

RBAC Working

Level	Role	Work in the application
1 (Top)	CEO	Overall control and view of all claims.
2	Claims Manager	Manages claim requests and watches claim processing.
3	Claims Officer	Handles individual claims and updates claim details.

The permission sets decide what a user can do. The role hierarchy decides whose records a user can see. A data sharing rule can add extra visibility where needed, for example a Read Only rule so one role can view records but cannot change them.

Observation

- Two custom permission sets were created, one for each working role, with clear descriptions.
- The Roles tab shows three levels. Claims Officer is the lowest level and CEO is the top level.
- Because of the hierarchy, higher roles can see the records of the roles under them, as long as their permissions allow it.
- The application shows a trial account that expires in 6 days.

Limitations

The Data Sharing tab and share rules were studied as a concept. No share rule is shown in the screenshots, so none is claimed as saved in this report.

Conclusion

Role-based access control makes the Insurance Claim application safer and easier to manage. Permission sets give each role the right actions, and the role hierarchy controls who can see which records. Together they follow the least privilege idea, so users get only the access they need.

Final Result

- The permission sets Claims_Manager_Permission and Claims_Officer_Permission were listed in the Permissions tab.
- The role hierarchy CEO > Claims Manager > Claims Officer was displayed in the Roles tab.
- The working of data sharing and Read Only access was studied.
